HUMMELSTOWN BROWNSTONE
COMPANY

WALTONVILLE, PENNSYLVANIA

TELEGRAPH AND EXPRESS ADDRESS
BROWNSTONE, PA.

LONG DISTANCE TELEPHONE

Mount Pleasant Press
J. HORACE McFARLAND COMPANY
HARRISBURG, PA.

Hummelstown Brownstone

THE main office, mill, shops and quarries of the Hummelstown Brownstone Company are located at Waltonville, Dauphin county, Pa., about ten miles east of Harrisburg.

Access to the quarries is had through the B. & M. Railroad, which is controlled by the owners of the Hummelstown

Brownstone property. The railroad consists of a line, extending from Brownstone, on the Lebanon Valley Branch of the Philadelphia and Reading railroad, to Waltonville, with extensive sidings both at Brownstone and at the quarries. It is equipped with four locomotives, passenger coaches and freight cars, used almost exclusively for the business of the Hummelstown Brownstone Company.

The property of the Company includes a thousand acres, covering all the high-grade

HUMMELSTOWN BROWNSTONE

brownstone in this section. The quarries are equipped with thirty steam derricks, one heavy-capacity steam shovel, three steam cable hoists, and a complete line of steam drills, quarry chiselers and other quarrying tools.

The mill and stone-dressing shops (see pages 9, 12 and 13; also pages 24, 25, 38 and 39, showing general view of mill) contain thirteen gangs of saws, fourteen stone planers and two stone lathes. The hoisting about the mill and shop is done by two heavy-capacity steam traveling cranes.

The capacity of the quarries is practically unlimited, having always been able to meet every demand. Stone of any size or quantity can be supplied, and the promptness and certainty with which orders have been filled have contributed in no small degree to the success of the Company.

The growth of the stone industry at Waltonville has been steady, rapid and substantial. Near the Brownstone station is an old road-wagon crumbling to pieces. It is not so very many years since all the stone shipped from Waltonville was hauled on this old wagon. To-day the forest of derricks, the miles of railway sidings and railway tracks to the different openings, the mass of machinery and the multitude of workmen, tell an interesting story of industrial progress.

While Hummelstown Brownstone is pre-eminently a building stone, it is also used

HUMMELSTOWN BROWNSTONE

other bridges. This one, however, is as substantial as when that it is an all-stone bridge, the arch as well as the abutments being built of Hummelstown Brownstone. A supply of bridge stone is always kept on hand and can be furnished in all sizes and in any quantity, at any time.

Hummelstown Brownstone is used for all classes of work for which any rock may be used, but it is preëminently a building stone—one of the most valuable, and adapted to many different structural purposes. The stone combines in high degree

extensively for bridges, piers and abutments. One of the earliest stone railroad bridges built in this country is shown on this page. It was built in 1850, entirely of Hummelstown Brownstone. Since that date the increased weight of engines and loaded cars has compelled the reconstruction of many built. It is worthy of note also

H U M M E L S T O W N B R O W N S T O N E

all the best qualities of building stone—strength, durability, comparative ease in working, and permanency of color. The product of the Hummelstown Brownstone Company is the most widely and favorably known of the Pennsylvania building stones, and has a high place among the best known and handsomest building stones of the country. It is "remarkably uniform both in texture and color, probably unsurpassed in this property by any brownstone in the United States, certainly not by any that occurs in similarly large quantities, so far as observed by the writer."—*State Report, page 51.*

"In large cities and in manufacturing towns, particularly those where bituminous coal is the

principal fuel, light stones should always be avoided, and for such localities a red or brown silicious sandstone is the most enduring and permanent, and next to this comes granite."—*Kidder on Building Construction, page 140.*

The Tenth Census, vol. 10, page 156, says: "One of the principal quarries in Pennsylvania on rocks of this age is at Hummelstown, Dauphin county, a few miles east of Harrisburg. The material here is a brown, massive sandstone of a uniform and medium texture, and is quarried for caps, sills, trimmings, bases, steps and other building purposes. It has been

HUMMELSTOWN BROWNSTONE

much used in Philadelphia, Harrisburg, Williamsport, Pottsville, Reading, Lancaster, York, Richmond, Baltimore, Washington and other cities of the east. * * * Blocks of as large size as are desirable may be taken out."

Durability

The Hummelstown Brownstone has been in local use for more than two hundred years. Tombstones made of it, dating back to the earlier years of 1700, are to be seen in the ancient cemetery near the quarry. They have weathered perfectly. The Berst house (see page 12), also on the quarry property, was built in the year 1800, and the barn adjoining was built in 1809. Both are of Hummelstown Brownstone, and in neither is there a sign of old age. The tool marks are as clear and well defined as they were when the buildings were erected. These buildings adjoin the quarries, and are examined with great interest by visitors.

GENERAL VIEW QUARRY

o. 4, LOOKING WEST

J. HORACE McFARLAND
HARRISBURG

HUMMELSTOWN BROWNSTONE

The State Report on Brownstones, speaking of the Berst house, says: "The stone shows no sign of decay or discoloration." The Census of 1880 says: "The Hummelstown Brownstone, the hardest and most compact of all these brownstones, has been introduced here (Philadelphia) within the last fifteen years. This stone as yet shows no evidence of disintegration

in any of the buildings in which it has been used, and has the reputation of being quite substantial and durable."

Color

From the standpoint of color, brownstone is the best of building stones. This is not only because of the beauty and richness of the color, but also

HUMMELSTOWN BROWNSTONE

because of what is of the highest importance in architecture, the permanency of the color. There is not another color common among building stones as little liable to tarnish as brown. The Berst house was mentioned as an illustration of the durability of the stone. It is no less a magnificent illustration of the permanency of the color of the stone. The State Report on Brownstone says: "In some brownstone buildings that have been standing nearly 169 years the stone is as bright as when it first came from the quarry. * * * The inherent beauty and permanency in the color, together with its desirability in combination with stones of other colors for architectural effect, will always cause a demand for brownstone by the best architects."

Ratio of Absorption

Baker, page 20)

<i>Kind of material</i>	<i>Maximum</i>	<i>Minimum</i>	<i>Average</i>
Granites	1-150		1-750
Marbles	1-150		1-300
Limestones	1-20	1-500	1-38
Sandstones	1-15	1-240	1-24
Bricks	1-4	1-50	1-10
Mortars	1-2	1-10	1-4

The Pennsylvania State College test, made in 1897, gives the ratio of absorption for Hummelstown Brownstone as 1-37.

The physical and chemical composition

HUMMELSTOWN BROWNSTONE

of a stone has much to do with its durability. When composed largely of silica and well cemented, sandstones are as resistant to the weather as granite, and far less affected by the action of fire.

Composition

The analysis given below shows the chemical composition of the Hummelstown Brownstone. It was made in the chemical laboratory of Pennsylvania State College.

Chemical Analysis of Hummelstown Brownstone

	Per cent
Silica	90.341
Alumina	4.350
Ferric oxide	1.093
Ferrous oxide749
Lime953
Magnesia167
Soda188
Potash	1.299
Water612
Total	<u>99.752</u>

"Experiments made with the Government testing machine at Watertown, Mass., 1882 and 1883, gave 700 tons per square foot ultimate crushing load for blue marble

HUMMELSTOWN BROWNSTONE

from Montgomery county, Pa.; 500 for limestone from Indiana; 840 for red sandstone from Hummelstown, Pa.; 260 to 1,000 for yellow Ohio sandstone." — *Trautwine*, page 437.

In a list of tests on 62 specimens of the best known sandstones of the United States, including brownstones, given by General Gillmore in 1875, there are 17 with a strength below 6,000, 43 below 9,000 and 49 below 10,000 pounds per square inch.

United States Government tests made at Watertown arsenal, and similar tests made at State College and Rose Polytechnic Institute indicate that Hummelstown Brownstone has a crushing strength of from 13,000 to 15,000 pounds per square inch. What this means may be seen when it is known that the maximum pressure on the masonry of the Brooklyn Bridge is about 400 pounds per square inch, and the maximum pressure on the masonry of the Washington Monument, at Washington, D. C., the highest work of masonry in the world, is 280 pounds to the square inch.

The texture of Hummelstown Brownstone is very fine and even, and this renders it particularly well adapted for handsome carving. Details of carving, pages 40 and 41.

HUMMELSTOWN BROWNSTONE

The stone is composed of fine angular quartz grains well cemented, and, as Professor Hopkins reports, "both the chemical and mineralogical composition leave little to be desired in that line."—

State Report, page 55.

"coloration caused by smoke."—*Kidder, on Building Construction, page 145.*

A marked point of superiority of the Hummelstown Brownstone was shown in the fire test made at State College, as described in the appended extract from the State Report (page 32): "When specimens of various sandstones and the oölitic limestone from Indiana, were heated until aluminum melted on the upper surface, about 1,157 degrees Fahrenheit, the limestones showed traces

Fire Resistance

"The ability of a stone to withstand the action of fire is often of much consequence, especially when it is exposed to fire risks on all sides, as is the case with most business blocks. Of the different kinds of stone used for building, the compact, fine-grain sandstones withstand the action of fire the best; limestones and marbles suffer the worst (becoming calcined under an intense heat), and granites are intermediate. The best sandstones generally come out uninjured, except for the dis-

H U M M E L S T O W N B R O W N S T O N E

of calcination by a coating of lime over the surface. The Hummelstown stone was brighter colored, but the texture and strength seemed unchanged, showing that it withstood, without damage, a heat which practically destroyed other stones."

The *Hummelstown Brownstone* commends itself as having, in a very high degree, all the most desirable qualities of the best building stone.

1. It is rich and uniform in color.
2. It is permanent in color.
3. It is strong and durable.
4. It is unlimited in quantity.
5. It is fine and uniform in texture, permitting the finest carving and architectural finish.
6. It is the best stone for a fire-proof building.
7. It does not stain or tarnish.
8. The Hummelstown Brownstone Company has a large and well-equipped plant, so that the largest orders can be filled promptly and without delay.
